Implement SGD Classifier with Logloss and L2 regularization Using SGD without using sklearn

There will be some functions that start with the word "grader" ex: grader_weights(), grader_sigmoid(), grader_logloss() etc, you should not change those function definition.

Every Grader function has to return True.

Importing packages

In [1]:
```
import numpy as np
import pandas as pd
from sklearn.datasets import make_classification
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn import linear_model
import matplotlib.pyplot as plt

# import warnings
# warnings.filterwarnings("ignore")
import tqdm
from tqdm import tqdm
```

Creating custom dataset

In [2]:
```
# please don't change random_state
X, Y = make_classification(n_samples=50000, n_features=15,
n_informative=10, n_redundant=5,
                           n_classes=2, weights=[0.7], class_sep=0.7,
random_state=15)
# make_classification is used to create custom dataset
# Please check this link (https://scikit-
learn.org/stable/modules/generated/sklearn.datasets.make_classification.html)
 for more details
```

In [3]:
```
X.shape, Y.shape
```

Out[3]:
```
((50000, 15), (50000,))
```

Splitting data into train and test

In [4]:
```
#please don't change random state
X_train, X_test, Y_train, Y_test = train_test_split(X, Y, test_size=0.25,
random_state=15)
```

In [5]:
```
# Standardizing the data.
scaler = StandardScaler()
X_train = scaler.fit_transform(X_train)
X_test = scaler.transform(X_test)
```

In [6]:
```
X_train.shape, Y_train.shape, X_test.shape, Y_test.shape
```

Out[6]:
```
((37500, 15), (37500,), (12500, 15), (12500,))
```

In [7]:
```
print (X_train[0])
print (Y_train[0])
```

```

Implement Logistic Regression with L2 regularization Using SGD: without using sklearn

1. We will be giving you some functions, please write code in that functions only.
2. After every function, we will be giving you expected output, please make sure that you get that output.

- Initialize the weight_vector and intercept term to zeros (Write your code in def initialize_weights())
- Create a loss function (Write your code in def logloss())

  $log loss = -1*\frac{1}{n}\Sigma_{for each Yt,Y_{pred}}(Ytlog10(Y_{pred})+(1-Yt)log10(1-Y_{pred}))$
- for each epoch:
  - for each batch of data points in train: (keep batch size=1)
    - calculate the gradient of loss function w.r.t each weight in weight vector (write your code in def gradient_dw())

      $dw^{(t)} = x_n(y_n − σ((w^{(t)})^{T} x_n+b^{t}))- \frac{λ}{N}w^{(t)})$
    - Calculate the gradient of the intercept (write your code in def gradient_db()) check this

      $ db^{(t)} = y_n- σ((w^{(t)})^{T} x_n+b^{t}))$
    - Update weights and intercept (check the equation number 32 in the above mentioned pdf):
      $w^{(t+1)}← w^{(t)}+α(dw^{(t)}) $

      $b^{(t+1)}←b^{(t)}+α(db^{(t)}) $
  - calculate the log loss for train and test with the updated weights (you can check the python assignment 10th question)
  - And if you wish, you can compare the previous loss and the current loss, if it is not updating, then you can stop the training
  - append this loss in the list (this will be used to see how loss is changing for each epoch after the training is over)

Initialize weights

In [11]:
```
def initialize_weights(dim):
    ''' In this function, we will initialize our weights and bias'''
    #initialize the weights to zeros array of (1,dim) dimensions
    #you use zeros_like function to initialize zero, check this link
https://docs.scipy.org/doc/numpy/reference/generated/numpy.zeros_like.html
    #initialize bias to zero
```
